//clone_lib="Lambda-PRI.2"
//note="Vector: lambda Zip-Lox; Site_l: Sal; Site_2: Not;
Lambda PRLZ is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark-rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
siliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
oligo dT primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T45874 1inear EST 09-JAN-1998 9137 Lambda-PRL2 Arabidopsis thaliana cDNA clone 133F15T7, mRNA

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                             The present sequence represents Arabidopsis thaliana histone deacetylase designated AtHDAA. The protein is homologous to yeast RPD3 and HDA1. The polynucleotide sequence is used in the method of the invention. The specification describes a method for regulating gene expression in transgenic plants. The method comprises modifying histones by introducing chimeric nucleotide sequences which have regulatory elements in operative association with a gene of interest or with a nucleotide sequence encoding histone deacetylase. The method is useful for regulating the developmental, physiological or biochemical pathway within a plant, particularly for repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation). The method is also useful as a functional test for identifying a phenotype associated with perturbing a gene. The histone deacetylase genes are useful for altering the development of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

The present sequence represents Arabidopsis thaliana histone deacetylase designated AtHDA2B. The protein is homologous to yeast RPD3 and HDA1. The polynucleotide sequence is used in the method of the invention. The specification describes a method for regulating gene expression in transgenic plants. The method comprises modifying histones by introducing chimeric nucleotide sequences which have regulatory elements in operative association with a gene of interest or with a nucleotide sequence encoding histone deacetylase. The method is useful for requlating the particularly for repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation). The method is also useful perturbing a gene. The histone deacetylase genes are useful for altering the development of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Methods for regulating gene expression in transgenic plants, e.g. repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation), comprises introducing genes encoding histone deacetylase
                                                                                                                                                                                                                                       Histone deacetylase; AtHDA2B; RPD3; gene expression; transgenic plant;

belonging to family 2, ZmHD2. This enzyme responsible for removing acetyl modifications, may be localised to promoters targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DMA. The HD uncleotide sequence can be used for producing transgenic plants with increased disease resistance.

Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are

This enzyme responsible for removing acetyl modifications, may be localised to promoters targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DNA. The HD nucleotide sequence can be used for producing transgenic plants with increased disease resistance. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize histone deacetylase; HD; HD cDNA; family 2, ZmHD2; gene repression; acetyl modification; promoter; regulatory element; transgenic plant; disease resistance; toxin screening; pathogenicity;

Maize histone deacetylase; HD; HD cDNA; family 2, ZmHD2; gene repression; acetyl modification; promoter; regulatory element; transgenic plant; disease resistance; toxin screening; pathogenicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            removing acetyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is maize histone deacetylase encoded by HD cDNA belonging to family 2, ZmHD2. This enzyme responsible for removing acety modifications, may be localised to promofers targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DNA. The HD nucleotide sequence can be used for producing transgenic plants with increased disease resistance. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are regulated by histone deacetylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New deacetylase genes, used for producing transgenic plants which have

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is maize histone deacetylase encoded by HD CDNA belonging to family 2, ZmHD2. This enzyme responsible for removing acetyl modifications, may be localised to promoters targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DNA. The HD nucleotide sequence can be used for producing transpenic plants with increased disease resistance. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are regulated by histone deacetylase.
                                                                                                                                                                                                                                                                                                                                                                                              Maize histone deacetylase; HD; HD cDNA; family 2, ZmHD2; gene repression; eceryl modilication; promoter; regulatory element; transgenic plant; disease resistance; toxin screening; pathogenicity; disease response promoter.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
